

StyleDeck — Functional Summary

Part One: The Customer Experience

What the Customer Sees

StyleDeck presents itself to the customer as a personal fashion curation platform. The experience is frictionless, editorial, and entirely free of the mechanics that power it behind the scenes. Customers never see approvals, restrictions, access tiers, or brand decisions. They simply see fashion — or they don't.

1. Account Creation & Login

The customer creates a personal StyleDeck account using either an email and password or their existing Google account. Once logged in, their profile, saved items, measurements, and gifting history are stored uniquely to them and persist across every session. Two customers logging into the same device see entirely different experiences.

2. The Measurement Profile

Before or during their first Custom category session, the customer is prompted to complete their tailor's measurement chart. This is a full-body measurement form covering:

- **Upper body** — height, weight, neck, chest or bust, shoulder width, sleeve length, bicep, wrist, back and front length (with additional bust-specific fields for the women's profile)
- **Lower body** — waist, abdomen, hip, thigh, knee, calf, inseam, outseam, rise, and ankle
- **Head and feet** — hat size, head circumference, shoe size, foot width, and foot length (women's profile adds typical heel height)
- **Posture and fit notes** — free-text notes for the tailor, fit preference (Slim / Regular / Relaxed / Oversized), and any additional instructions

The form supports both metric (cm) and imperial (inches) with live unit conversion. A progress bar tracks completion. The completed chart can be exported as a formatted PDF — a professional tailor's document carrying the customer's name, date, gender profile, and all measurements in clean section-by-section layout with a signature line, ready to hand directly to any tailor or bespoke atelier.

The measurement profile is accessible at any time from the customer's avatar in the top navigation, and is prompted automatically when the customer selects the Custom category for the first time.

3. The Swipe Deck — Discovering Fashion

The centrepiece of the customer experience is the swipe deck: a Tinder-style stack of fashion cards the customer moves through by dragging left (pass) or right (like), or by tapping the ✕ and ♥ buttons beneath the card.

Before swiping, the customer selects a category from a dropdown:

- **Casual** — everyday and streetwear
- **Business** — professional and contemporary
- **Formal** — black tie, evening, and occasion wear
- **Custom** — bespoke and made-to-measure

Each category displays the participating brands as chips beneath the selector, giving the customer a sense of who is represented in that space.

Each card shows:

- The product name and brand
- A category label
- A 🎁 gift icon or 💰 purchase icon — visible before the customer makes any selection, so they always know the nature of what they are looking at
- A hero image selected by the brand

Swiping behaviour:

- Drag right or tap ♥ — the item is saved to the personal gallery
- Drag left or tap ✕ — the item is passed and removed from the deck
- The ↔ undo button restores the last card and removes it from the gallery if it was liked, allowing the customer to change their mind
- A counter beneath the deck shows items remaining and items reviewed in the current session
- When all items in a category are reviewed, the deck shows a clean completion state

The deck is reshuffled fresh each time the customer selects a category, so repeated sessions feel like new discoveries.

4. The Personal Gallery — Saved Wardrobe

The **Saved** tab holds everything the customer has liked, organised by the four categories. A live badge on the tab shows the total count of saved items. The gallery opens with a row of four stat cards — one per category — showing how many items are saved in each. Beneath that, items are grouped by category with section headers and item counts.

Each saved item shows the product image, name, and brand. Items that a brand has subsequently deactivated appear as greyed out with a "no longer available" indicator, preserving the history without creating a dead link.

5. What the Customer Never Sees

This is as important as what they do see:

- They never see that certain brands are not available to them
- They never see an "access denied" message, a "request access" button, or any signal that a selection decision has been made about them
- They never see dollar figures related to gifting budgets
- They are never contacted directly by a brand through the platform
- They never see another customer's profile, gallery, or measurements

When a customer's gifting allowance with a specific brand is fully consumed, they receive a single clear notification: *"Your gifting account with [Brand] has been fully allocated for this period. It will reset on [date]."* No dollar amounts are shown. No further explanation is given. Products from that brand simply pause until the period resets — automatically.

Part Two: The Brand Experience

What the Brand Admin Sees

Every approved brand on StyleDeck has a private, fully isolated portal. No brand can see another brand's products, customers, allowances, or data. The portal is the brand's complete operational workspace for everything from onboarding to fulfilment.

1. Brand Registration & Onboarding

A new brand visits the StyleDeck Brand Portal and submits a self-registration form including brand name, primary contact, category (Casual / Business / Formal / Custom), admin email, fulfilment email address, and agreement to platform terms.

On submission, the StyleDeck platform team receives an immediate dashboard notification flagging the new application for review. The brand account sits in a **pending** state — the brand can log in and see their status, but cannot access any operational features until approved.

The StyleDeck team reviews the application and either approves or rejects it with a documented reason. On approval, the brand's portal unlocks fully. On rejection, the brand receives a clear message and can contact support to reapply.

This gate ensures no brand goes live on the consumer app with an empty or unapproved storefront.

2. The Product Catalogue

The catalogue is the brand's inventory workspace, organised by the four categories. Within each category, brands manage individual product cards.

Adding a single product, the brand fills in:

- Product name and description
- Category (Casual / Business / Formal / Custom)
- Item type — **Gift** 📁 or **Purchase** \$ — which determines how the product appears to customers and what fields are required
- Brand cost price (internal, never shown to customers — used for gifting allowance tallying)
- Retail price (purchase items only)
- Return and exchange policy — a mandatory free-text field for all purchase items, locked until completed; cannot be bypassed
- Up to **three product images**, uploaded by URL. The first image is automatically the hero (card-facing) image. The brand can drag to reorder and designate any of the three as the hero. A fourth image cannot be added — the form enforces the cap with a clear inline message.

Bulk import allows brands with large catalogues to upload products via a structured CSV. Each row follows the same field schema as the single product form. Invalid rows (missing required fields, too many images, purchase items without return policies) are flagged individually with their row number and error reason. Valid rows are committed immediately. The brand sees a clear summary of how many rows succeeded and how many failed, with actionable error detail for each failure.

Active / Inactive toggle — every product has a single switch. When a brand discontinues a product, they flip it inactive. It disappears immediately from all customer views, including existing saved galleries where it appears as "no longer available." This replaces seasonal archiving — there are no seasons in StyleDeck, only live and not live.

3. Customer Access Manager

This is the brand's tool for deciding who sees their products. At the top of the section, the brand sets their **access policy**:

- **Open** — all StyleDeck customers see the brand's products automatically, no action required. Appropriate for Casual and accessible brands.
- **Selective** — only customers the brand has explicitly approved see their products. All others see nothing from that brand, with no indication of the gap.
- **Invite-Only** — the brand's products are entirely invisible on the platform unless the brand has proactively approved the customer. Appropriate for high-fashion and luxury brands.

The customer list shows all StyleDeck customers not subject to a platform-level restriction against this brand. Each row displays the customer's name, industry (Film, Music, Sports, Business, Media, Technology, Fashion, Other), and their current access status. The brand can filter the list by industry to make targeted approval decisions quickly.

For each customer, the brand can:

- **Approve** — grants access immediately; the customer begins seeing the brand's products in their deck on their next session
- **Deny** — removes access; the customer sees nothing from that brand, silently

Brands have **no ability to contact customers directly** through the platform. The customer access manager is a one-way operational tool only.

4. Gifting Allowance Management

For customers on a gifting programme, the brand sets a **per-customer gifting budget** directly in the customer's row within the access manager. The brand specifies:

- A **dollar limit** (e.g. \$15,000) — this is the brand's internal cost value of merchandise, not retail price
- A **time-frame** — Rolling 30, 60, or 90 days; Calendar Quarter; or Calendar Year

Once set, a progress bar appears on the customer's row showing the percentage of the allowance consumed, with a reset date. The brand can adjust the limit at any time, and can manually reset a customer's allowance ahead of schedule — useful for special events, contract renewals, or relationship management.

The customer never sees any of these figures. The tally runs silently in the background. When the limit is reached, the customer receives a single notification with the reset date. When the period expires, the allowance resets automatically and the customer's access to that brand's gifted products resumes without any action required by the brand.

5. Shipping Invoice (Option C — Current)

When a customer finalises a selection for shipment, StyleDeck automatically generates a structured PDF invoice and sends it to the brand's designated fulfilment email address. The invoice includes:

- StyleDeck order reference number
- Brand name and internal brand ID
- User reference (anonymised token or agreed display name — brand's choice)
- All selected items with product name, category, quantity, and brand cost price
- Shipment type (Gift or Purchase) with appropriate notation
- Return and exchange policy for any purchase items, pulled directly from the product record
- Gifting programme summary — allowance reference, period, amount consumed prior to this order, amount consumed by this order, and remaining balance after dispatch
- Shipping address city and state (full address released to the brand only at confirmed dispatch)
- Platform notes reminding the brand that cost prices are internal and not for disclosure to the customer

Brands with unconfirmed orders after 48 hours receive a follow-up notification. A daily digest at 08:00 brand local time summarises all pending orders not yet actioned.

6. Portal Settings

The brand's settings section provides:

- **Access policy management** — switching between Open, Selective, and Invite-Only with plain-language descriptions of the effect of each
- **Brand profile** — name, category, admin email, and fulfilment email, all editable
- **Fulfilment email address** — the destination for all automated shipping invoices

For Your Sales Documentation

A few framing points worth carrying into the slide deck:

For the customer pitch: StyleDeck is a personal style discovery platform that connects curated fashion directly to the people who wear it. The experience is effortless, editorial, and private.

For the brand pitch: StyleDeck gives fashion brands a controlled, private channel to place product — gifted or commercial — with exactly the right people, with zero cold contact, full budget control, and automated fulfillment handoff.

The platform's core value proposition sits in the gap between those two experiences: the customer feels like they are discovering fashion organically, while the brand is making precise, data-informed decisions about who sees what, at what cost, over what timeframe. Neither party sees the other's mechanics. StyleDeck is the layer in between.
